	absolute value and distance?	and divide rational numbers. 7.NS.1. Apply and extend previous understandings of	• Quizzes
	• Why does multiplying a whole	addition and subtraction to add and subtract rational	• Tests
	number by a fraction or decimal	numbers; represent addition and subtraction on a	
	less than one give you a smaller	horizontal or vertical number line diagram.	
	number?	a. Describe situations in which opposite quantities	
		combine to make 0. For example, a hydrogen	
	• Why is adding the opposite the	atom has 0 charge because its two constituents	
	same as subtracting?	are oppositely charged.	
	• What are the process similarities	b. Understand $p + q$ as the number located a distance $ q $ from p , in the positive or negative	
	and differences when adding,	distance $ q $ from p , in the positive of negative direction depending on whether q is positive or	
	subtracting, multiplying and	negative. Show that a number and its opposite	
	dividing rational numbers?	have a sum of 0 (are additive inverses). Interpret	
	• Why is a negative number,	sums of rational numbers by describing real-	
	multiplied by a negative number,	world contexts.	
	always a positive number?	c. Understand subtraction of rational numbers as	
		adding the additive inverse, $p - q = p + (-q)$.	
	Absolute value	Show that the distance between two rational numbers on the number line is the absolute value	
		of their difference, and apply this principle in	
	Integer operations	real-world contexts.	
	Rational number operations	d. Apply properties of operations as strategies to	
	Order of operations	add and subtract rational numbers.	
		7.NS.2. Apply and extend previous understandings of	
		multiplication and division and of fractions to multiply	
		and divide rational numbers.	
		a. Understand that multiplication is extended from fractions to rational numbers by requiring that	
		operations continue to satisfy the properties of	
		operations, particularly the distributive property,	
		leading to products such as $(-1)(-1) = 1$ and the	
		rules for multiplying signed numbers. Interpret	
		products of rational numbers by describing real-	
		world contexts.	
		b. Understand that integers can be divided,

November- December	Unit 2: Expressions & Equations • When solving an algebraic equation, why do you perform the same operation on both the left and the right side of the equation? • When is it necessary to use an inequality instead of an equation to represent a situation? • What are inverse operations? • Adding and subtracting linear expressions • Distributing and factoring expressions • Translating and solving multi-step equations • Translating and solving inequalities	 provided that the divisor is not zero, and every quotient of integers (with non-zero divisor) is a rational number. If <i>p</i> and <i>q</i> are integers, then – (<i>p</i>/<i>q</i>) = (-<i>p</i>)/<i>q</i> = <i>p</i>/(-<i>q</i>). Interpret quotients of rational numbers by describing real-world contexts. c. Apply properties of operations as strategies to multiply and divide rational numbers. d. Convert a rational number to a decimal using long division; know that the decimal form of a rational number terminates in 0s or eventually repeats. 7.NS.3. Solve real-world and mathematical problems involving the four operations to generate equivalent expressions. 7.EE.1. Apply properties of operations as strategies to add, subtract, factor, and expand linear expressions with rational coefficients. 7.EE.2. Understand that rewriting an expression in different forms in a problem context can shed light on the problem and how the quantities in it are related. <i>For example, a</i> + 0.05<i>a</i> = 1.05<i>a means that "increase by 5%" is the same as "multiply by 1.05."</i> Solve real-life and mathematical problems using numerical and algebraic expressions and equations. 7.EE.3. Solve multi-step real-life and mathematical problems using numerical and algebraic expressions and equations. 7.EE.3. Solve multi-step real-life and mathematical problems using numerical and algebraic expressions and equations. 7.EE.3. Solve multi-step real-life and mathematical problems using numerical and algebraic expressions and equations. 7.EE.3. Solve multi-step real-life and mathematical problems using numerical and algebraic expressions and equations. 7.EE.3. Solve multi-step real-life and mathematical problems using numerical and algebraic expressions and equations. 7.EE.3. Solve multi-step real-life and mathematical problems using numerical and algebraic expressions and equations. 7.EE.3. 		additional 1/10 of her salary an hour, or \$2.50, for a new salary of \$27.50. If you want to place a towel bar 9 3/4	

Time	Essential Questions/Content	Standards/Skills	Assessments
		 inches long in the center of a door that is 27 1/2 inches wide, you will need to place the bar about 9 inches from each edge; this estimate can be used as a check on the exact computation. 7.EE.4. Use variables to represent quantities in a real-world or mathematical problem, and construct simple equations and inequalities to solve problems by reasoning about the quantities. Solve word problems leading to equations of the form <i>px</i> + <i>q</i> = <i>r</i> and <i>p(x</i> + <i>q)</i> = <i>r</i>, where <i>p</i>, <i>q</i>, and <i>r</i> are specific rational numbers. Solve equations of these forms fluently. Compare an algebraic solution to an arithmetic solution, identifying the sequence of the operations used in each approach. For example, the perimeter of a rectangle is 54 cm. Its length is 6 cm. What is its width? Solve word problems leading to inequalities of the form <i>px</i> + <i>q</i> > <i>r</i> or <i>px</i> + <i>q</i> < <i>r</i>, where <i>p</i>, <i>q</i>, and <i>r</i> are specific rational numbers. Graph the solution set of the inequality and interpret it in the context of the problem. For example: As a salesperson, you are paid \$50 per week plus \$3 per sale. This week you want your pay to be at least \$100. Write an inequality for the number of sales you need to make, and describe the solutions.

December - February	 Unit 3: Ratios & Proportional Relationships How is a rate converted to a unit rate? What are some basic comparisons that can be made using unit rates? What is a proportion? How can you tell if two ratios are proportional? How can you find the constant of proportionality from different presentations of data? How can you use proportional relationships to find percents? Computing unit rates Determining proportionality (table, graph) Identifying constant of proportionality (table, graph, equation, diagram) Solving multi-step ratio and percent problems 	 Analyze proportional relationships and use them to solve real-world and mathematical problems. 7.RP.1. Compute unit rates associated with ratios of fractions, including ratios of lengths, areas and other quantities measured in like or different units. For example, if a person walks 1/2 mile in each 1/4 hour, compute the unit rate as the complex fraction ^{1/2}/_{1/4} miles per hour, equivalently 2 miles per hour. 7.RP.2. Recognize and represent proportional relationships between quantities are in a proportional relationship. e.g., by testing for equivalent ratios in a table or graphing on a coordinate plane and observing whether the graph is a straight line through the origin. Identify the constant of proportionality (unit rate) in tables, graphs, equations, diagrams, and verbal descriptions of proportional relationships. Represent proportional relationships by equations. For example, if total cost t is proportional to the number n of items purchased at a constant price p, the relationship between the total cost and the number of items can be expressed as t = pn. Explain what a point (x, y) on the graph of a proportional relationships to solve multistep ratio and percent problems. Examples: simple interest, tax, markups and markdowns, gratuities and commissions, fees, percent increase and decrease, percent error. 	 Prep-tasks Skills checks Quizzes Tests

February - March	 <u>Unit 4: Geometry</u> What is the relationship between scale drawings and proportions? What are the formulas to find area and circumference of circles? How are they related? 	Draw construct, and describe geometrical figures and describe the relationships between them. 7.G.1. Solve problems involving scale drawings of geometric figures, including computing actual lengths and areas from a scale drawing and reproducing a scale drawing at a different scale.	 Prep-tasks Skills checks Quizzes Tests
	 Finding lengths within and creating scale drawings Area and circumference of circles Area of polygons Volume and surface area prisms 	Solve real-life and mathematical problems involving angle measure, area, surface area, and volume. 7.G.4. Know the formulas for the area and circumference of a circle and use them to solve problems; give an informal derivation of the relationship between the circumference and area of a circle.

March - April	 Unit 5: Statistics & Probability What is probability? How does NOT and OR effect the probability of an event? Will the predicted number of favorable outcomes of a probability experiment agree with the generated sample? In what types of questions would a tree diagram be useful when used to list the "sample space"? How is probability calculated if there is more than one event? What is the difference between a population and a sample? Predicting about a population from a sample Expressing measures of variability Probability of simple events Predictions Creating tree diagrams for sample space 	 Use random sampling to draw inferences about a population. 7.SP.1. Understand that statistics can be used to gain information about a population by examining a sample of the population; generalizations about a population from a sample are valid only if the sample is representative of that population. Understand that random sampling tends to produce representative samples and support valid inferences. 7.SP.2. Use data from a random sample to draw inferences about a population with an unknown characteristic of interest. Generate multiple samples (or simulated samples) of the same size to gauge the variation in estimates or predictions. For example, estimate the mean word length in a book by randomly sampling words from the book; predict the winner of a school election based on randomly sampled survey data. Gauge how far off the estimate or prediction might be. Draw informal comparative inferences about two populations. 7.SP.3. Informally assess the degree of visual overlap of two numerical data distributions with similar variabilities, measuring the difference between the centers by expressing it as a multiple of a measure of variability. For example, the mean height of players on the basketball team is 10 cm greater than the mean height of players on the soccer team, about twice the variability (mean absolute deviation) on either team; on a dot plot, the separation between the two distributions of heights is noticeable. 	 Prep-tasks Skills checks Quizzes Test

Time	Essential Questions/Content	Standards/Skills	Assessments
		7.SP.4. Use measures of center and measures of	
		variability for numerical data from random samples to	
		draw informal comparative inferences about two	
		populations. For example, decide whether the words in	
		a chapter of a seventh-grade science book are	
		generally longer than the words in a chapter of a	
		fourth-grade science book.	
		Investigate chance processes and develop, use, and	
		evaluate probability models.	
		7.SP.5. Understand that the probability of a chance	
		event is a number between 0 and 1 that expresses the	
		likelihood of the event occurring. Larger numbers	
		indicate greater likelihood. A probability near 0	
		indicates an unlikely event, a probability around 1/2	
		indicates an event that is neither unlikely nor likely,	
		and a probability near 1 indicates a likely event.	
		7.SP.6. Approximate the probability of a chance event	
		by collecting data on the chance process that produces	
		it and observing its long-run relative frequency, and	
		predict the approximate relative frequency given the	
		probability. For example, when rolling a number cube	
		600 times, predict that a 3 or 6 would be rolled roughly	
		200 times, but probably not exactly 200 times.	
		7.SP.7. Develop a probability model and use it to find	
		probabilities of events. Compare probabilities from a	
		model to observed frequencies; if the agreement is not	
		good, explain possible sources of the discrepancy.	
		a. Develop a uniform probability model by	
		assigning equal probability to all outcomes, and	
		use the model to determine probabilities of	
		events. For example, if a student is selected at	

Time	Essential Questions/Content	Standards/Skills	Assessments
		random from a class, find the probability that	
		Jane will be selected and the probability that a	
		girl will be selected.	
		b. Develop a probability model (which may not be	
		uniform) by observing frequencies in data	
		generated from a chance process. For example,	
		find the approximate probability that a spinning	
		penny will land heads up or that a tossed paper	
		cup will land open-end down. Do the outcomes	
		for the spinning penny appear to be equally	
		likely based on the observed frequencies?	
		7.SP.8. Find probabilities of compound events using	
		organized lists, tables, tree diagrams, and simulation.	
		a. Understand that, just as with simple events, the	
		probability of a compound event is the fraction	
		of outcomes in the sample space for which the	
		compound event occurs.b. Represent sample spaces for compound events	
		using methods such as organized lists, tables	
		and tree diagrams. For an event described in	
		everyday language (e.g., "rolling double	
		sixes"), identify the outcomes in the sample	
		space which compose the event.	
		c. Design and use a simulation to generate	
		frequencies for compound events. <i>For example</i> ,	
		use random digits as a simulation tool to	
		approximate the answer to the question: If 40%	
		of donors have type A blood, what is the	
		probability that it will take at least 4 donors to	
		find one with type A blood?	

Time	Essential Questions/Content	Standards/Skills	Assessments
April - June	 Unit 6: Geometry What are the differences/similarities between prisms and pyramids? How can you remember the names of special angle pairs and their relationships? Constructing triangles Special angle pairs Area of polygons Volume and surface area of prisms 3-D decompositions 	Draw, construct, and describe geometrical figures and describe the relationships between them. 7.G.2. Draw (freehand, with ruler and protractor, and with technology) geometric shapes with given conditions. Focus on constructing triangles from three measures of angles or sides, noticing when the conditions determine a unique triangle 7.G.3. Describe the two-dimensional figures that result from slicing three-dimensional figures, as in plane sections of right rectangular prisms and right rectangular pyramids. Solve real-life and mathematical problems involving angle measure, area, surface area, and volume. 7.G.5. Use facts about supplementary, complementary, vertical, and adjacent angles in a multi-step problem to write and solve simple equations for an unknown angle in a figure. 7.G.6. Solve real-world and mathematical problems involving area, volume and surface area of two-and three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes, and right prisms.
